

## Principles of Computer Science II

### Sequence Similarity

Ioannis Chatzigiannakis

Sapienza University of Rome

#### Lecture 6

## Equivalent Words

Transform one English word  $v$  into another word  $w$  by going through a series of intermediate English words, where each word in the sequence differs from the next by only one substitution (1 character).

- ▶ Given two words  $v, w$  and a dictionary, find out whether the words are equivalent.
- ▶ Your program should output the series of transformations for  $v$  to become  $w$
- ▶ Use the following dictionary: <https://goo.gl/hBvqqr>
- ▶ Example: To transform **head** into **tail** one can use four intermediates:  
head → heal → teal → tell → tall → tail

## Generalized Equivalent Words

Find an algorithm to solve a generalization of the Equivalent Words problem when insertions, deletions, and substitutions are allowed (rather than only substitutions).

- ▶ Given two words  $v, w$  and a dictionary, find out whether the words are equivalent.
- ▶ Your program should output the series of transformations for  $v$  to become  $w$
- ▶ Use the following dictionary: <https://goo.gl/hBvqqr>
- ▶ Example: To transform **head** into **tea** one can use four intermediates:  
head → heal → teal → tea

## Edit Distance

- ▶ We looked for repeating patterns within DNA sequences.
- ▶ How can we measure the similarity between different sequences?
- ▶ We use the notion of Vladimir Levenshtein introduced in 1966
- ▶ **Edit distance** – the minimum number of editing operations needed to transform one string into another (insert/delete symbol or substitute one symbol for another).

### Alignment of ATATATAT vs TATATATA

A	T	A	T	A	T	A	T	-
:	:	:	:	:	:	:	:	:
-	T	A	T	A	T	A	T	A

## Sequence Similarity

Alignment of ATATATAT vs TATAAT

```
A T A T A T A T
  : : : : : : :
- T A T A - A T
```

## Sequence Similarity

Alignment of TGCATAT vs ATCCGAT

```
TGCATAT
  ↓      delete last T
TGCATA
  ↓      delete last A
TGCAT
  ↓      insert A at the front
ATGCAT
  ↓      substitute C for G in the third position
ATCCAT
  ↓      insert a G before the last A
ATCCGAT
```

Five operations.

## Sequence Similarity

Alignment of TGCATAT vs ATCCGAT

```
TGCATAT
  ↓      insert A at the front
ATGCATAT
  ↓      delete T in the sixth position
ATGCAAT
  ↓      substitute G for A in the fifth position
ATGCCAT
  ↓      substitute C for G in the third position
ATCCGAT
```

Four operations.

## Edit Distance

- ▶ Vladimir Levenshtein defined the notion of **Edit distance**
- ▶ Did not provide an algorithm to compute it.

## Edit Distance Algorithm using Dynamic Programming

- ▶ Assume two strings:
  - ▶  $v$  (of  $n$  characters)
  - ▶  $w$  (of  $m$  characters)
- ▶ The alignment of  $v, w$  is a two-row matrix such that
  - ▶ first row: contains the characters of  $v$  (in order)
  - ▶ second row: contains the characters of  $w$  (in order)
  - ▶ spaces are interspersed throughout the table.
- ▶ Characters in each string appear in order, though not necessarily adjacently.

A	T	-	G	T	T	A	T	-
A	T	C	G	T	-	A	-	C

- ▶ No column contains spaces in both rows.
- ▶ At most  $n + m$  columns.

## Edit Distance Algorithm using Dynamic Programming

A	T	-	G	T	T	A	T	-
A	T	C	G	T	-	A	-	C

- ▶ **Matches** – columns with the same letter,
- ▶ **Mismatches** – columns with different letters.
- ▶ Columns containing one space are called **indels**
  - ▶ Space on top row: **insertions**
  - ▶ Space on bottom row: **deletions**

$$\# \text{ matches} + \# \text{ mismatches} + \# \text{ indels} < n + m$$

## Representing the rows

<b>v</b>	A	T	-	G	T	T	A	T	-
<b>w</b>	A	T	C	G	T	-	A	-	C

- ▶ One way to represent  $v$ 
  - ▶ AT-CGTAT-
- ▶ One way to represent  $w$ 
  - ▶ ATCGT-A-C
- ▶ Another way to represent  $v$ 
  - ▶ AT-CGTAT-
  - ▶ 122345677
  - ▶ **number of symbols of  $v$  present up to a given position**
- ▶ Similarly, to represent  $w$ 
  - ▶ ATCGT-A-C
  - ▶ 123455667

## Representing the rows

<b>v</b>	A	T	-	G	T	T	A	T	-
<b>w</b>	A	T	C	G	T	-	A	-	C

<b>v</b>	1	2	2	3	4	5	6	7	7
<b>w</b>	1	2	3	4	5	5	6	6	7

can be viewed as a coordinate in 2-dimensional  $n \times m$  grid:

$\binom{0}{0}$	$\binom{1}{1}$	$\binom{2}{2}$	$\binom{2}{3}$	$\binom{3}{4}$	$\binom{4}{5}$	$\binom{5}{5}$	$\binom{6}{6}$	$\binom{7}{6}$	$\binom{7}{7}$
----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------	----------------

The entire alignment is simply a path:

$(0, 0) \rightarrow (1, 1) \rightarrow (2, 2) \rightarrow (2, 3) \rightarrow (3, 4) \rightarrow (4, 5) \rightarrow (5, 5) \rightarrow (6, 6) \rightarrow (7, 6) \rightarrow (7, 7)$

## Edit distance graph

- ▶ **Edit graph:** a grid of  $n, m$  size.
- ▶ The edit graph will help us in calculating the edit distance.
- ▶ Alignment: a path from  $(0, 0)$  to  $(n, m)$ .
- ▶ Every alignment corresponds to a path in the edit graph.
- ▶ Diagonal movement at point  $i, j$  correspond to column  $\begin{pmatrix} v_i \\ w_j \end{pmatrix}$
- ▶ Horizontal movement correspond to column  $\begin{pmatrix} - \\ w_j \end{pmatrix}$
- ▶ Vertical movement correspond to column  $\begin{pmatrix} v_i \\ - \end{pmatrix}$

## Edit distance graph

## Profile most-frequent k-mer

```
def edit_distance(s1, s2):
    m=len(s1)+1
    n=len(s2)+1

    tbl = {}
    for i in range(m): tbl[i,0]=i
    for j in range(n): tbl[0,j]=j
    for i in range(1, m):
        for j in range(1, n):
            cost = 0 if s1[i-1] == s2[j-1] else 1
            tbl[i,j] = min(tbl[i, j-1]+1,
                           tbl[i-1, j]+1,
                           tbl[i-1, j-1]+cost)

    return tbl[i,j]
```

## Profile most-frequent k-mer

```
def levenshteinDistance(s1, s2):
    if len(s1) > len(s2):
        s1, s2 = s2, s1

    distances = range(len(s1) + 1)
    for i2, c2 in enumerate(s2):
        distances_ = [i2+1]
        for i1, c1 in enumerate(s1):
            if c1 == c2:
                distances_.append(distances[i1])
            else:
                distances_.append(1 + min((distances[i1],
                                             distances[i1 + 1],
                                             distances_[-1])))

        distances = distances_
    return distances[-1]
```
